

What is energy storage system (ESS)?

Energy Storage System (ESS) refers to one or more devices, assembled together, capable of storing energy in order to supply electrical energy. a. This set of fire safety requirements applies to ESS which supply electrical energy at a future time to the local power loads, to the utility grid, or for grid support.

Where should the energy storage system be located?

All Energy Storage System installations shall be located at the same storey as the fire engine accessway/fire engine access road. c. The allowable Maximum Stored Energy for the various battery technologies in each compartment shall be as listed in Table 10.3.1. a It shall refer to an aggregated stored energy capacity per compartment.

What are ESS fire safety requirements?

a. This set of fire safety requirements applies to ESS which supply electrical energy at a future time to the local power loads, to the utility grid, or for grid support. It shall apply to ESS installations where the total stored energy exceeds the Threshold Stored Energy listed in Table 10.3.1 below.

What are the requirements for a containerised ESS unit?

(b) Each containerised ESS unit shall be served by an independent wet deluge system with a minimum discharge density of 12.2mm/min and provided with a breeching inlet to allow direct charging of water supply to the main control valve.
