

## **Britain will build wind power for solar telecom integrated cabinets**

The Twyn Hywel wind farm, which already has the green light from planning authorities, promises to supply power to around 81,000 houses upon completion.

A new Oxford Smith School working paper<sup>1</sup> finds Great Britain's (GB) wind and solar resources are more than sufficient to meet all its energy needs, both practically and economically.

In 2025, wind, solar, hydro and biomass generated more than 127 terawatt hours (TWh) of electricity in Great Britain, according to BBC analysis of provisional Neso data.

The policy briefing paper, published this morning by the University of Oxford, researchers at the Smith School of Enterprise and Environment, argues Britain could feasibly install enough solar ...

In Great Britain's most competitive auction for renewable subsidies to date, energy companies vied for contracts that guarantee the price for each unit of clean electricity they generate.

Britain's energy needs could be met entirely by wind and solar, according to a policy brief published today by Oxford's Smith School of Enterprise and the Environment.

A new wind record has been set for Britain, with enough electricity generated from turbines to power 22 million homes, the system operator has said.

"We know a system dominated by wind and solar is the lowest cost for bill payers, and we look forward to working with Government now that it has a clear road map to achieving this."

The new UK Government is committed to double onshore wind and quadruple offshore wind by 2030, as a cornerstone of its goal to fully decarbonise electricity by 2030.

Dozens of clean energy projects, including wind and solar power, will jump to the front of the queue for grid connections, as the government paves the way for a new era of clean electricity...
