

What is battery balancing?

Battery balancing is the process of equalizing the charge among individual cells within a battery or between batteries in a group to maintain consistent voltage levels and state of charge (SOC). This ensures that no cell is overcharged or undercharged, helping to prevent performance issues, capacity loss, and a shortened battery lifespan.

Why should you use a battery balancing system (BMS)?

Balancing batteries might seem like an extra chore, but it's vital for maintaining the health, safety, and performance of your power systems. By using a BMS, following manual balancing steps when needed, and maintaining good charging habits, you can dramatically extend the life of your batteries.
