

In this paper, a partial soft-switching SiC-based ANPC inverter with loss model-based dead time optimization is proposed. 800-V input is adopted to save cost for the front boost ...

Soft switching is achieved through the use of additional circuitry and control action. Usually, this is at the expense of other aspects of the converter (e.g., complexity, cost, etc.), but the trade can be worthwhile.

The principle of operation, shown in Fig. 1, enables intermittent positive voltage to be applied to the inverter via a diode clamp by generating higher resonance (about 50 kHz) than the inverter current ...

High Frequency-Link (HFL) Inverters have been employed to integrate renewable energy sources into utility grids and electric vehicles. The soft-switching range of High-Frequency Link ...

Formal conditions for soft-switching and methods for achieving ZVS while maintaining global synchronization are presented. These conditions are then verified in a simulation.

In this paper, a novel soft-switching strategy is proposed to enhance the soft-switching operation and then improve conversion efficiency. This study effectively integrates the scheme of ...

Soft-switching (SS) technique is an important way to achieve high conversion efficiency and high switching frequency for power converters, which is beneficial to improve power density and ...

This article presents a comprehensive review of the soft-switching topologies used in single-phase photovoltaic (PV) inverters for residential applications.

The soft switching technology allows the switch to switch instantly when the voltage or current at both ends is zero or extremely small, thereby avoiding switching loss and EMI problems.

In this paper, a novel soft-switching strategy is proposed to ...
